

I live in a rural community which to date, has been plagued with power line interference. Adding another RFI source more then likely 10 times more intense due to usage, such as BPL will offer, will render communications useless. To date, I have had little compliance with requests to reduce the RFI from the unmaintained power lines/equipment. Most utility companies do not maintain the power poles, lines, drop lines, ground straps, etc. Emissions of electrical RFI is just something that do not take serious. Addition of BPL will only make the RFI situation much, much worse and likely, known amateurs in the community will likewise be blamed for the RFI caused to private homes.
